FAR SELF-SERVICE ARCHITECTURE

Platform Groups + Tenant Groups Integration Blueprint

This document describes the proposed self-service architecture for the FAR (RAG) platform. The design separates platform-level authorization from tenant-level authorization and eliminates the FAR team as a bottleneck for day-to-day user access management.

CURRENT GLOBAL AD GROUP IMPLEMENTATION

- **Baseline Setup:** The system currently utilizes a single global Active Directory (AD) group (e.g., `SPG_FAR_RAG`) to manage access to the platform layout.
- **The Operational Bottleneck:** Because it is a single monolithic group layer, it cannot parse granular tenant boundaries or track separate client configurations. This structure forces the core FAR engineering team to manually step in to handle every single day-to-day user provisioning or isolation request.

1. CORE CONCEPTS

Platform Groups (Enterprise-wide)

- `FAR_ADMIN`
- `FAR_PRODUCT_OWNER`
- `FAR_DEVELOPER`

These groups determine what structural administrative capabilities a user can execute within the FAR platform environment itself.

Tenant Groups (One Group Per Tenant)

- `RAG_CLIENT_A`
- `RAG_CLIENT_B`
- `RAG_CLIENT_C`

These groups map out environment context to determine exactly which tenant space(s) a user can view. Specific roles inside that workspace partition are kept stored directly within the FAR configuration tables.

2. TENANT ONBOARDING FLOW

Only one tenant group is created per tenant. Once initialized, the assigned **Client ATC** (Access Control Lead) assumes full administrative responsibility for daily team membership management.

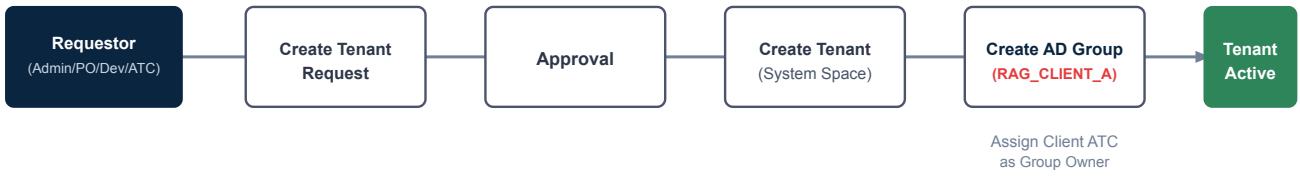

FIGURE 2.1: CONTINUOUS CORE TENANT PROVISIONING SEQUENCE MAP

3. USER ACCESS FLOW

- **Decoupled Provisioning:** The FAR team is completely excluded from user provisioning loops after initial tenant environment onboarding operations resolve.
- **Delegated Access Management:** When a new internal worker requests membership additions for an existing environment workspace, they submit an access ticket via corporate infrastructure (ServiceNow/SailPoint) targeting the respective group string (e.g., `RAG_CLIENT_A`). The ticket routes directly to the assigned **Client ATC** for approval, tracking entirely outside the FAR engineering backlog.

4. SELF-SERVICE LOGIN AND AUTHORIZATION FLOW

PROBLEMS SOLVED BY FAR SELF-SERVICE ARCHITECTURE

BUSINESS VALUE & OPERATIONAL BENEFITS SPECIFICATION

1. Self-Service Onboarding

Users can log in through the FAR Self-Service Portal using SSO and perform onboarding activities based on their assigned platform role.

BENEFIT:

- **Faster onboarding**
- **Reduced dependency on the FAR team**

2. Tenant-Based Access Control

Since access is controlled through tenant-specific AD groups (e.g., RAG_CLIENT_A, RAG_CLIENT_B), only authorized users can access their respective tenant data.

BENEFIT:

- **Better tenant isolation**
- **Simplified access management**

3. SSO Integration Across FAR Applications

The same SSO mechanism can be used for the FAR Portal, Playground, and future applications.

Since tenant membership comes from AD groups, the platform can automatically determine:

- Who the user is
- Which tenant they belong to
- What they are allowed to access

BENEFIT:

- **Consistent authorization across all FAR applications**

4. Solves Current Global LDAP Group Limitation

Currently, a global LDAP group provides platform access but does not distinguish between different tenants.

With tenant-specific AD groups:

- Tenant ownership becomes clear
- Requests can be separated by tenant
- Access can be controlled at the tenant level

> **BENEFIT:**
> - **Proper multi-tenant authorization**

5. Offloading Authorization Responsibility to IAM

User provisioning, deprovisioning, group membership, and access approvals are managed through the enterprise IAM process.

> **BENEFIT:**
> - **FAR team no longer manages day-to-day access requests**
> - **IAM becomes the source of truth for authorization**
> - **Improved governance and auditability**

OVERALL OUTCOME

- **Self-service onboarding**
- **SSO-based access management**
- **Tenant-aware authorization**
- **Better tenant segregation**
- **Reduced FAR operational overhead**
- **Authorization ownership delegated to IAM and Client ATCs**
